AI Builder Cup

Build in JAPAC.
Build for the world.

# Team Details

Team name: SignalLedger

Team leader name: Zhangwei

Team member: Chen Jiaoyi

Problem Statement: Social trading lacks durable context, and an author's visible result is often not a follower's realized result.

# Brief about the idea

A KOL-first context layer for trading communities.

SIGNALLEDGER

## Follow the people shaping the market conversation.

Users browse public authors. SignalLedger preserves what was said, adds professional context, and makes follower impact visible.

**CLAIM**

What did the author actually say?

**QUALITY**

Was evidence and downside context present?

**IMPACT**

Could a delayed follower reproduce the result?

**FAIRNESS**

Can an author add context without rewriting history?

# Opportunities

A large information problem sits between social discovery and responsible action.

**DIFFERENT**

Most trading products optimize for speed, engagement, or prediction. SignalLedger optimizes for durable context around the people influencing decisions.

**PROBLEM FIT**

Users already follow authors across broker communities, X, newsletters, podcasts, and crypto feeds. The record is fragmented.

**USP**

The author's visible result is separated from a realistic follower path, with source links and explainable labels.

**Moat: a longitudinal, cross-source accountability graph — not another generic AI score.**

# List of features offered by the solution

A community workflow with a professional context layer beside it.

### 01 KOL-first Discover

Auto-loaded author feed with search, market filters, public-source labels.

### 02 Context Card

Original wording, asset, direction, horizon, risk disclosure, evidence quality.

### 03 Follower Impact

Visible narrative versus delayed-entry scenario and maximum pain.

### 04 Author Profile

Disclosure habits, promotional pressure, correction behavior, follower gap.

### 05 Source Traceability

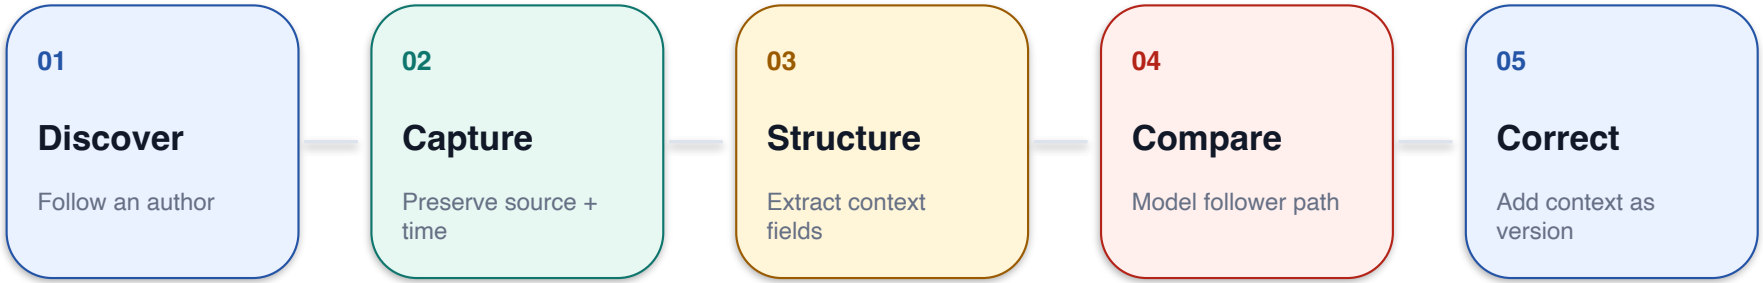

Public RSS/article links, delayed market snapshots, cached fallback state.

### 06 Fairness Flow

Author additions and corrections saved as new versions.

# Process flow diagram / Use-case diagram

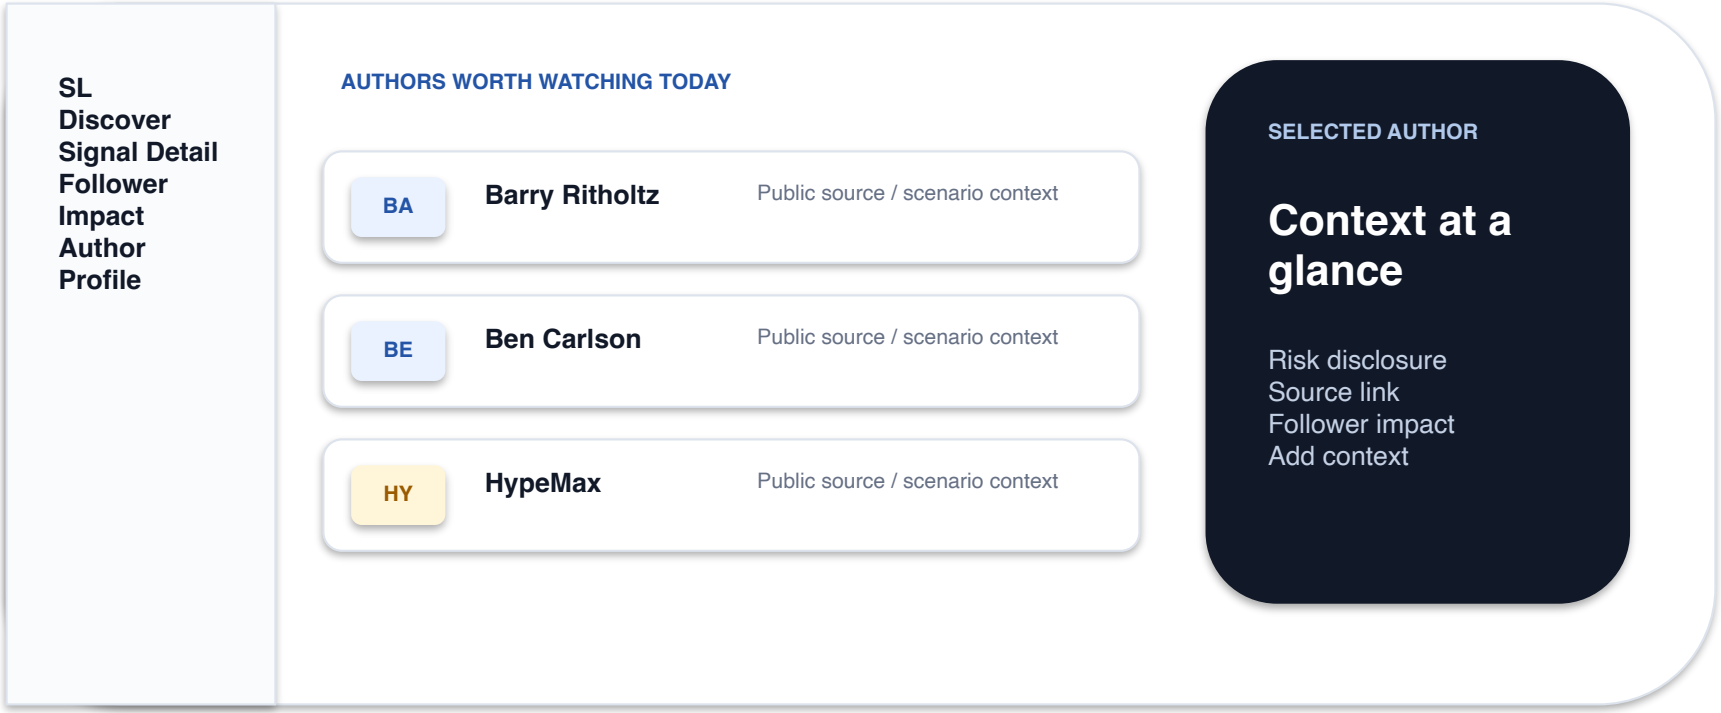

From an author's public post to a durable context record.

**User question: “Can I understand this author before I act on the post?”**

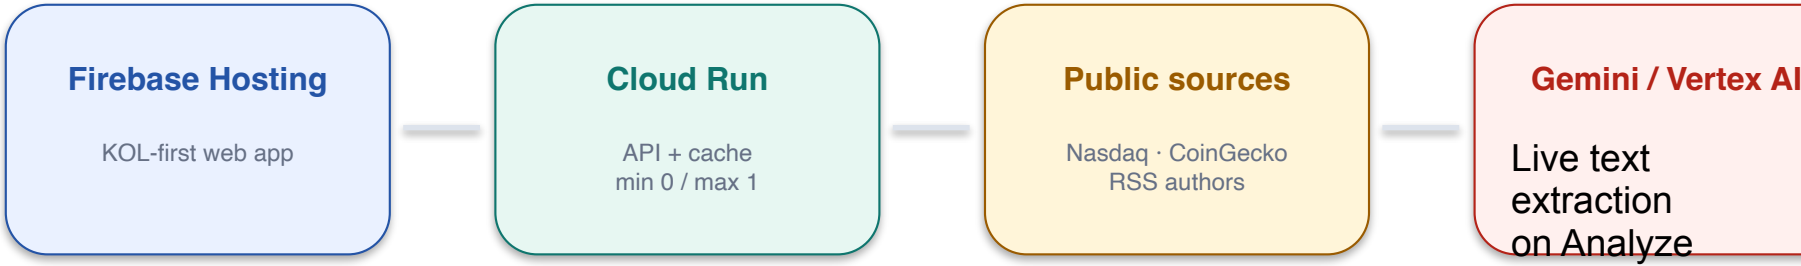

# Wireframes / Mock diagrams of the proposed solution

The first screen is a community feed, not an empty dashboard.

# Architecture diagram of the proposed solution

Firebase Hosting serves the app; Cloud Run keeps data and model access behind an API.

**Versioned context records → author graph → follower-impact scenarios**

Public Demo calls Gemini only after an explicit Analyze action; no automatic model calls on feed load.

# Technologies to be used in the solution

The prototype is deployed and the production path is intentionally modular.

**Frontend**

HTML · CSS · JavaScript
Firebase Hosting

**API**

Node.js · Cloud Run
Public-source cache

**AI path**

Gemini / Vertex AI
Gemini 2.5 Flash
structured extraction

**Data**

Nasdaq · CoinGecko
RSS + Firestore
roadmap

Google Cloud services are used for deployment, API isolation, caching, and the live Gemini path.

# Estimated implementation cost

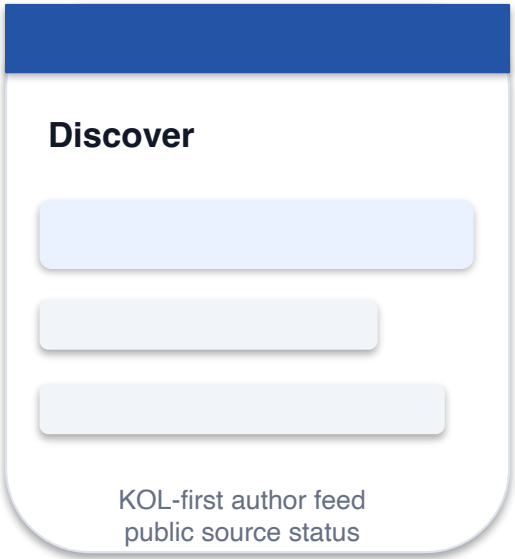

A controlled public Demo with explicit Gemini analysis actions.

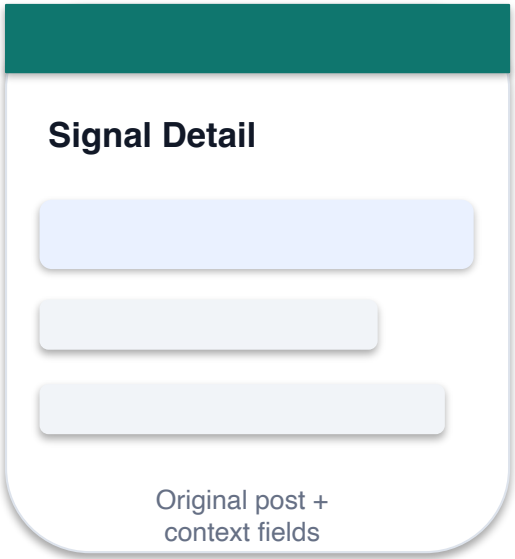

| Mode | What runs | Cost posture | Status |
|---|---|---|---|
| Demo | Firebase + Cloud Run + Vertex AI Explicit Analyze action | Usage-based; user-triggered | DEPLOYED |
| Live AI | Vertex AI Gemini 2.5 Flash | Usage-based; user-triggered | DEPLOYED |
| Scale | Firestore + BigQuery licensed sources | Future budgeted tier | ROADMAP |

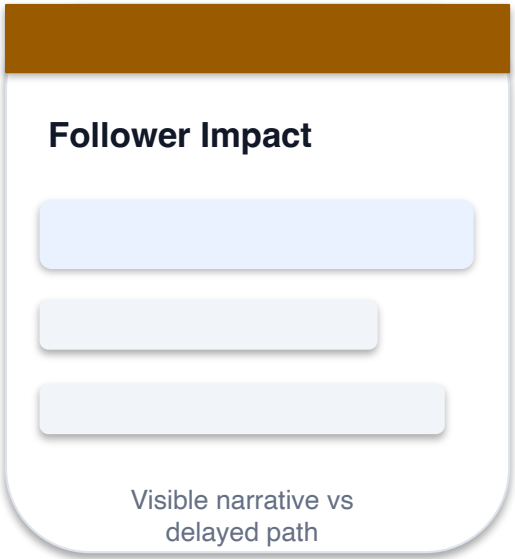

No private data; model calls occur only after an explicit Analyze action.

# Snapshots of the prototype

The public URL is working; the key workflow is visible without a live presentation.

# Prototype Performance report / Benchmarking

Measured on the deployed prototype before submission.

| 200 | 200 | 200 | 7 |
| --- | --- | --- | --- |
| Firebase home response | Public author feed API | Market snapshot API | Author cards after feed load |

- Cloud Run: min 0, max 1, 256 MiB, request-based CPU throttling.
- Public RSS items keep source URLs; unavailable feeds fall back without breaking the app.
- DOM interaction smoke test: filters, search, profile navigation, and signal detail navigation passed.

# Additional Details / Future Development

The prototype is intentionally narrow; the moat compounds with authorized longitudinal data.

01

## Live Gemini extraction

Enable multimodal text + screenshot extraction when a budget is approved.

02

## Licensed platform connectors

Add authorized broker/community integrations instead of scraping restricted platforms.

03

## Longitudinal graph

Firestore + BigQuery for author history, corrections, and follower scenarios.

04

## User trust controls

Following lists, source confidence, report flow, and transparent appeals.

# Provide links to your

All core links are live, including the subtitled demo video.
